

give me the datasheet for FLBS-601EM

I'm checking manufacturer listings and distributor pages to pin down the exact FLBS-601EM part and pull together a clean datasheet-style summary.

Thought for 14s

I found **FLBS-601EM** as a **self-service book sterilizer / document disinfecting cabinet**, likely from **Hangzhou Folo Technology**. I could not find a clean official PDF datasheet from the manufacturer, but I did find consistent spec listings from the manufacturer page and reseller/spec pages. HzFolo +3

FLBS-601EM Datasheet-Style Summary

Product name: FLBS-601EM
Product type: Self-service book sterilizer / document disinfecting cabinet
Primary use: UV-C disinfection of books and similar paper items. HzFolo +1

Key specifications

Item	Specification
Model	FLBS-601EM
Power supply	220 V, 50 Hz
Input power	250 W
Target items	Books
Capacity per cycle	6 books
Sterilization method	UV-C ultraviolet light
UV lamp count	12 groups / 12 sets
Sterilization time	30 seconds
Display	10.1-inch multimedia display

Item	Specification
Control mode	One-click start
Colors	Black mirror / White / Blue
Dimensions	660 × 650 × 1530 mm
Cabinet material	Double-layer environmentally friendly aluminum profile
Weight	150 kg

Product description

The FLBS-601EM is a freestanding **library/book disinfection cabinet** designed for quick UV-C sterilization of up to **6 books per cycle**. It uses **12 UV-C lamp groups** and completes a cycle in about **30 seconds**, with a **10.1-inch display** and **one-button operation**, making it suitable for libraries, archives, schools, and public document handling areas.

HzFolo +2

Notes

There is a small discrepancy in the sources on dimensions: one source lists **660 × 620 × 1530 mm**, while the manufacturer/reseller pages list **660 × 650 × 1530 mm**. The manufacturer page supports **660 × 650 × 1530 mm**, so that is the more reliable figure.

HzFolo +2

Reference pages

- Manufacturer product page: Hangzhou Folo Technology page for FLBS-601EM.

give me the price for it and give me the information for technical design for it

I'm pulling current market listings for pricing and then I'll break down the likely technical design blocks so you have both a buying view and an engineering view.

I found a current retail listing with an actual posted price. Next I'm translating that into a practical technical design view, since the manufacturer page gives specs but not internal schematics.

Thought for 13s

Price for FLBS-601EM

I found a live retail listing for **FLBS-601EM** showing a **sale price of HK\$42,000** and a **list price of HK\$56,000**. The same listing describes it as a self-help book disinfecting cabinet and matches the core specs from the manufacturer. Lon10 +2

Using a simple **HKD→USD** conversion at **7.8 HKD/USD**, that is about **USD 5,385** sale price and **USD 7,179** list price. This is only a rough currency conversion, not a quoted US-market selling price.

Technical design information

The manufacturer-facing specs indicate this is a **220 V / 50 Hz, 250 W, UV-C book sterilizer for 6 books per cycle**, using **12 UV lamp groups**, with a **30-second cycle**, **10.1-inch multimedia display**, and **one-click start** control. The cabinet is about **660 × 650 × 1530 mm**, uses **double-layer aluminum profile** construction, and weighs about **150 kg**.

HzFolo +1

Because I could not find an official circuit diagram or service manual, the design below is a **grounded engineering inference** based on the published specifications and how commercial UV-C sterilizer cabinets are typically built. HzFolo +1

1. Functional architecture

The likely internal design is:

1. AC input and power stage

220 VAC input, EMI filtering, fuse/protection, main power distribution, and separate rails for control electronics, display, and UV lamp drive.

2. Main controller board

A small MCU or embedded controller handles button input, door/interlock monitoring, lamp timing, countdown logic, and fault shutdown.

3. HMI / media display module

The 10.1-inch display is likely a separate embedded display board or Android/Linux media module for UI, advertising, instructions, or status display.

4. UV-C sterilization chamber

Interior reflective chamber with 12 UV lamp positions arranged to expose the book covers and page gaps as evenly as possible.

5. Book holding / airflow guidance structure

Slots, supports, or shaped guides keep up to 6 books positioned so UV light can reach the exposed surfaces and page edges.

6. Safety interlock system

Door or access sensors immediately disable UV output if opened, to prevent UV exposure to users.

7. Optional fan / deodorizing / dust-removal subsystem

Some related product marketing around this family mentions deodorizing and dust-removal features, so the cabinet may include airflow elements, though this specific model page mainly confirms UV-C sterilization. HzFolo +1

2. Likely electrical block diagram

A practical engineering block view would look like this:

This architecture is consistent with a cabinet that has a short timed cycle, front-panel UI, and multiple UV lamps. HzFolo +1

3. UV chamber design concept

Since the machine sterilizes **6 books in 30 seconds** with **12 UV lamp groups**, the most likely arrangement is that lamps are placed around the book chamber to reduce shadowed areas. The design goal is not only to hit the outer cover, but also expose the partially fanned page surfaces or page edges. That matches reseller wording claiming treatment of both the cover and inside pages. HzFolo +1

In practice, such a chamber usually includes:

- **Reflective inner wall surfaces** to improve UV utilization
- **Fixed spacing geometry** between books to reduce shadowing
- **Mechanical guides** so users insert books in the correct orientation
- **Short-cycle timer logic** to standardize dose delivery

4. Safety design requirements

For a product like this, the most important technical safety points are:

- **Door-open UV cutoff**
- **Lamp enable through relay or interlocked driver stage**
- **Leakage shielding at windows and seams**
- **Timer watchdog**
- **Overcurrent / fuse protection**
- **Thermal management for ballast and electronics**

The reseller page also mentions an **anti-UV viewing window**, which supports the assumption that optical shielding and user observation were part of the design intent.

HKTVMall

5. Mechanical design overview

Based on the size, weight, and cabinet material, the machine is likely built as a **floor-standing aluminum-frame cabinet** with:

- outer decorative enclosure panels
- internal lamp mounting rails
- a central sterilization chamber
- front loading area and control panel
- lower compartment for power electronics, ballast/drivers, and service access

The **150 kg** weight suggests a fairly robust frame and internal metal structure, not just a light kiosk shell. HzFolo

6. What is still missing

I did **not** find these official engineering details online:

- internal circuit schematic
- PCB layout
- exact lamp type / wavelength / ballast model
- wiring diagram
- service manual
- maintenance part list
- UV irradiance map inside chamber

So for “technical design,” the safest answer is: the **published external specs are confirmed**, but the **internal engineering design must be inferred unless you have the manufacturer’s service documentation.** HzFolo +1

Practical engineering takeaway

If you want to **design a similar machine**, the core subsystems you would need are:

- 220 VAC input protection and power distribution
- UV-C lamp array with proper driver/ballast
- reflective sterilization chamber
- book-positioning mechanism for 6 books
- MCU-based timer/controller
- 10.1-inch HMI
- door interlock and UV safety cut-off
- optional airflow/deodorization module
- metal/aluminum floor-standing enclosure

If you want, I can turn this into a **clean PDF-style datasheet sheet plus a technical block diagram** for FLBS-601EM.
