

Manual Deburring Machine

ERSM® RMD-150 manual deburring machine is versatile starter model and the cost saving alternative for

Manual Deburring, Edge Rounding, and Polishing
of sheetmetal.

See For Yourself: The Video Of The ERSM[®] RMD-150!

RMD-150 Manual deburring is necessary for specialized products or low-volume runs. Manufacturers can skip over the sometimes lengthy programming process of an automated machine. It's also a better way to ensure a smooth finish on a part that's too fragile for automatic equipment.

Advantages Of The New Manual Deburring Machine

The new manual deburring machine offers **adjustable grinding head speed** for precise control, **easy arm height and angle adjustments** for versatile operation, and a **quick-change grinding head system** for tool-free head replacement. Combined with a lightweight servo motor and durable aluminum alloy arm, it ensures faster, more efficient deburring with minimal maintenance, making it the perfect solution for high-quality surface finishing.

Frequently Asked Questions

Why Choice Manual Deburring Machine?

Manual deburring machine is one of the products developed by our company with independent intellectual property rights, it is a surface treatment equipment for flat parts or tiny curved surfaces, which can be used for deburring, simple chamfering and grinding. Lightweight cantilever structure, gas spring support, lightweight servo motor, the overall weight is light, easy to operate and reduce the labor of workers, quick-change collet design, adjustable speed, touch screen control, can be adjusted for different boards and process requirements of different speed and grinding head, the use of flexible. Through the introduction of advanced design concepts, scientific design means, to solve the traditional design of the operation of the rigid, as well as easy to cause workers arm labor shortcomings.

RMD-150 Product Advantages

The deburring machine is simple in structure and convenient in operation, which has the flexibility of hand-held tools and can also achieve the flatness of automatic equipment. It can replace the traditional hand-held tools to improve the processing efficiency and precision, or be used as a supplement to the automatic equipment to make up for the errors and omissions generated by the automatic equipment, which is the ideal equipment for the sheet-metal industry to have high efficiency and stable output.

What Industry Is Suitable To Buy RMD-150?

It is widely used in sheet metal processing, chassis and cabinets, air-conditioning and refrigeration, elevators, kitchen equipment, aluminum veneer, household appliances and other complete sets of equipment

More Options tools for Manual Deburring

Hard for the removal of hard burrs. Medium for the removal of other (various) burrs.

Pregrinding, light deburring and finish grinding.

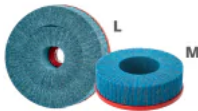

Pregrinding, primary burr removal.

Primary and secondary burrs + strong edge roundings.

Deburring and edge rounding of various metals.

Deburring and strong edge rounding of stainless steel with bigger radius.

Edge rounding and fine surface pattern for aluminium and plastic.

Deburring and edge rounding of (galvanized) thin plates and parts.

Removal of oxide layers.
